

Clinical finding of Infectious Diseases in Tibbe Akbari textbook in comparison to modern Medicine (Harrison textbook)

M. Avijgan, M. Mazaheri, F. salehzadeh

Abstract:

Background and Purpose: Infectious diseases are at top list of health problem. Traditional Persian Medicine has a diagnostic and preventive approach. We reviewed infectious diseases with the diagnostic and therapeutic views of Persian medicine, as well as a clinical examination in modern medicine that could be used for treatment resistant infections, which is the purpose of this article.

Materials and Methods: This review was carried out using a review method. The review of the book is about infectious diseases, which has been extracted and reviewed for 67 common infectious diseases including review, rewriting, and then comparison of them with the latest achievements of modern medicine. (A resource collection of 21 sources).

Conclusion: Most of the clinical symptoms and physical examination are comparable to modern medicine. Traditional medicine, however, has looked at infections like other illnesses with a humoral and temperamental outlook, and it has a view of Mizadj change. Also, since there is no place for antibiotics in traditional medicine, there is a complete disagreement in treatment. It seems that with more research and study in Persian medicine, it is possible to note the forgotten points of history taking and examination methods, which may be detected at a lower cost by using them. Although there is a significant difference in treatment, but given the increasing spread of antibiotic resistance, in the future, we might have to replace the old method of resistant antibiotics.

Keywords: Tibbe Akbari, infectious diseases, Persian traditional medicine.
