

Ethnobotanical study of medicinal plants of Fasa in Fars province

E. Hatami*, M. Zahedifar

Abstract:

Nowadays, medicinal plants are mostly considered by scientific and research centers because of their importance in sanitation and health of society. Ethnomedicine and ethnobotany are noteworthy issues in most countries such as Iran. In recent years, Iranian researchers has performed several studies on identification, introduction and, consumption methods of medicinal and aromatic plants in various regions. So, this study aimed to document medicinal plants of Fasa in Fars province.

This survey was done by field trips, information and beliefs of local people, identification, classification and, introduction of these medicinal plants. For each species, we provided scientific name, local name, parts used, forms of preparation, ways of applications and, their therapeutic properties.

Medicinal plant species in Fasa are used mainly in remediation of digestive and nervous system disease respectively. The results of the present investigations show that many plant species of this region have medicinal uses and economic values. So, the attention of people and natural resources managers is necessary to protect them from the risk of extinction.

Keywords: medicinal plants, ethnobotany, Fasa
